

Collaborative 44 · From Excel and email to intelligent supplier-order tracking

Internal note based on the source PDF provided by Carmen Vicente Zaragoza.

1. Context

Supplier-order follow-up still depends on a mix of Excel, email review and manual reading of confirmations. Delivery dates, incidents and commitments do not live in a single operating view, forcing the purchasing team into constant supervision.

The weakness is not only the time consumed, but the lack of structured anticipation when delays or changes end up affecting supply and production.

2. What fails today

Order confirmations arrive in emails and PDFs that someone must read, interpret and register manually.

Delay management is reactive, lead times are not sufficiently traceable and the process depends too much on individual knowledge.

3. Proposed solution

The proposal is to build an intelligent system that captures information from emails and attachments, centralizes order status and continuously monitors dates and commitments.

On top of that base, the system would trigger early alerts and allow the team to request confirmations or react before delay turns into a real supply issue.

Executive conclusion: the real leap is not just better order registration, but turning supplier follow-up into an anticipatory, traceable capability that helps the whole operating chain.
