Proposal to improve dock management

Current situation

Logistics operations are experiencing saturation, especially because most agency loads concentrate between 17:00 and 19:00. This creates workload peaks that lead to operational stress and a degree of disorganisation.

In addition, product unloading, especially when bulky goods coincide several times on the same day, blocks preparation areas and significantly hinders daily operations.

Change of approach

The proposal is framed as more than a technology tool: it represents an operational model change toward intelligent planning of loading and unloading through a dock scheduling system.

What a dock scheduling app would enable

- Centralise and organise planning with real-time visibility of available windows.
- Avoid overlap and dock overload.
- Reduce internal load on the logistics team by allowing supplier reservations.
- Work with 24 hours' notice to prepare orders, resources and reorganise exceptions.
- Assign teams and staff in advance and prepare goods before truck arrival.
- Capture punctuality, real processing times, peak hours and saturation data.
- Include automatic confirmations, reminders and delay or incident alerts.
- Increase control and traceability by knowing who booked each slot and under which conditions.

Operational logic

The proposed workflow starts with a simple choice: select loading or unloading, display available schedules and book a slot. Depending on supplier and operation type, the system automatically assigns the required dock occupation time. The booking could also be cancelled if the agreed time cannot be met.

Development example

Booking screen with available time slots.

Hora	Muelle 3	Muelle 4	Muelle 5	Muelle 6	Muelle 7	Muelle 10	Mue
07:30							
07:45							
08:00						Descarga | VIROLA	
08:15						Descarga | VIROLA	
08:30						Descarga | VIROLA	
08:45						Descarga | VIROLA	
09:00							
09:15							
09:30							
09:45							
10:00							
10:15							
10:30							
10:45							
11:00							
11:15							

Reservation confirmation and slot detail.

Operational view to track appointments and dock occupation.

Conclusion

The proposal aims to professionalise dock management through anticipatory, distributed and traceable planning, reducing saturation peaks and building a base for continuous improvement supported by real operating data.
